SS1160
Unipolar Hall-Effect Digital Switch

## Features and Benefits

-4.5 V to 24 V Operation

- $-40^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ Superior temperature operation
- Bipolar technology
- Open-collector 50 mA output
- Reverse battery protection
- Small Size SOT89 3L or SIP 3L
- Solid-state reliability
- Resistant to 60 V supply voltage
- Sensitivity of temperature compensation circuitry

## Application Examples

- Automotive, Consumer and Industrial
- Solid-state switch
- Brushless DC motor commutation
- Speed detection
- Linear position detection
- Angular position detection
- Proximity detection

## General Description

The SS1160 is a unipolar Hall-effect sensor IC fabricated from bipolar technology. The device integrates a voltage regulator, reverse battery protection diode, Hall sensor with dynamic offset cancellation system, temperature compensation circuitry, small signal amplifier, Schmitt trigger and an open-collector output to sink up to 50 mA . With suitable output pull up, they can be used with bipolar or CMOS logic circuits.

These Hall-effect switches are monolithic integrated circuits with tighter magnetic specifications, designed to operate continuously over extended temperatures to $+150^{\circ} \mathrm{C}$, and are more stable with both
temperature and supply voltage changes. Internal compensation characteristic makes the sensitivity increase slightly with temperature increasing, so that this IC is Particularly suitable to be used with the commonly low-cost magnets. If a magnetic flux density larger than threshold Bop, Output is turned on (low). When a magnetic flux density reversal falls below Brp, Output will be turned off (high).

Thanks to its wide operating voltage range, extended choice of temperature range and high reliability, it is quite suitable for use in automotive, industrial and consumer applications.

## Glossary of Terms

MilliTesla (mT), Gauss Units of magnetic flux density: $1 \mathrm{mT}=10$ Gauss
RoHS Restriction of Hazardous Substances
Operating Point $\left(\mathrm{B}_{\mathrm{OP}}\right) \quad$ Magnetic flux density applied on the branded side of the package which turns the output driver $\mathrm{ON}\left(\mathrm{V}_{\text {OUT }}=\mathrm{V}_{\text {DSon }}\right)$

Release Point (BRP) Magnetic flux density applied on the branded side of the package which turns the output driver OFF $\left(\mathrm{V}_{\text {OuT }}=\right.$ high $)$
